APPENDIX D NOISE MEASUREMENTS: MEASUREMENT-PLAN DETAILS

This appendix contains partial details about the study's noise-measurements (Section 4, above). In particular, it contains details about the study's measurement plan, which appear in the following project memorandum:

- Measurement Plan for NYSTA System-wide Noise Barrier Prioritization Study, HMMH memo of October 3, 2002.

This measurement plan is reproduced on the following pages.

From: Douglas Barrett

Date: October 3, 2002

Subject: Measurement Plan for NYSTA System-wide Noise Barrier Prioritization Study

Reference: HMMH Job No. 298550.003

1. INTRODUCTION

This memorandum provides the overall plan and specific procedures for traffic noise measurements to be conducted on behalf of the New York State Thruway Authority (NYSTA) by Bergmann Associates (BA), in association with their sub-contractors Fisher Associates (FA) and Harris Miller Miller & Hanson Inc. (HMMH). The traffic noise measurements are being conducted as part of a Thruway-wide noise barrier prioritization study.

Previously, BA conducted an initial screening analysis to identify candidate assessment areas for the Thruway-wide study¹. In addition, earlier noise reduction projects based on technical studies documenting noise impacts and project benefits have already been completed in Westchester and Rockland Counties, and Orange County (south of M.P. 50.02)^{2,3,4}. Noise barriers have been constructed in many Westchester and Rockland County locations, and are in various stages of design in several other locations within these counties.

The initial screening study used the following criteria to determine whether a location would be a candidate for further evaluation:

A density greater than 25 residential structures: To enhance the effectiveness of noise projects and ensure that they will benefit the greatest number of impacted residents, the density of the area is

¹ *Thruway-Wide Noise Study, Initial Screening (D213057: Assignment #2)*, Prepared for: New York State Thruway Authority, Prepared by: Bergmann Associates, Inc., P.C., July, 2002.

² *Noise Barrier Study, New England Division Westchester County, Interstate Route 95 Pelham/New Rochelle Border to Connecticut State Line*, Prepared for: New York State Thruway Authority, Prepared by: Berger, Lehman Associates, P.C., September 1987, revised September 1990.

³ *Noise Study Technical Report, Interstate Route 87 from the Hudson River to the Orange County line and the Garden State Parkway Connection*, Prepared for: New York State Thruway Authority, Prepared by: Rust Environment & Infrastructure, Inc., May 1996.

⁴ "Noise Mitigation Prioritization Study, I-87, Westchester, Rockland and Orange Counties, Final Technical Report," Acentech Report No. 251, Prepared by Acentech Incorporated, Prepared for Edwards & Kelcey Engineers, July 2000.

considered in the criteria for studying noise impacts. Thus, the eligibility of an affected area must include at least 25 residential structures.

Area for Potential Abatement Must be Within 200 feet of the Thruway: Noise reduction projects typically have a direct benefit within 500 feet from the source of the noise. Within this target zone, those residents that are closest to the Thruway are impacted the greatest by traffic noise and also stand to benefit the most from abatement measures. Beyond the 500-foot target zone the effectiveness of abatement measures diminishes significantly. In order to provide relief for those residents experiencing the worst noise impacts, the study eligibility criteria includes a requirement that the structures within the potential abatement area be located no more than 200 feet from the Thruway. For this priority study, the distance from the Thruway is taken to be the distance from the edge of pavement of the near lane of the mainline or ramp(s) to the residential structure in question.

NYSTA has established following three-tiered approach, as part of its Noise Abatement Policy, to determine the priorities for NYSTA funded noise abatement studies.

- 
- *Tier 1 – Residential Construction Prior to 1976:* The NYSTA will give first priority to studying all noise-impacted areas where residential structures were constructed prior to 1976.
 - *Tier 2 – Residential Construction Between 1976 and 1998:* Subsequent to completing studies eligible under Tier1, the Authority will evaluate noise in areas where residential structures were constructed between 1976 and 1998.
 - *Tier 3 – Residential Construction After 1998:* Areas where residential structures were constructed after 1998 will not be eligible for noise studies.

The remainder of this memorandum describes the measurement program and provides the following information:

- **Section 2** describes the purpose and provides guidance for each of the types of measurements that will be conducted.
- **Section 3** lists the assessment areas where measurements will be conducted and identifies the project team member assigned to each assessment area.
- **Section 4** provides the anticipated schedule.
- **Appendix C-A** provides samples of the field data sheets that will be used throughout the measurement program.
- **Appendix C-B** provides a copy of the letter of introduction provided by the NYSTA for measurement personnel requiring access to private property.
- **Appendix C-C** provides figures showing the locations of the assessment areas.

2. NOISE MEASUREMENT GUIDELINES

The noise measurement program will include both long-term and short-term measurements. This section of the memorandum describes the purpose, site-selection criteria, and procedures for each type of measurement.

2.1 Long-Term Measurements

One long-term (24-hour) measurement will be conducted in each assessment area.

2.1.1 Purpose

The purpose of the long-term measurements is to:

- Identify the loudest-hour of the day at a representative location within each assessment area where the noise level is dominated by Thruway traffic. The loudest hour will be used for traffic noise impact modeling and noise barrier design for the entire assessment area.
- Provide a basis for adjusting computed hourly noise levels to the 24-hour Day-Night Sound Level (L_{dn}) metric required for the priority evaluation.

2.1.2 Site Selection

The long-term measurement sites should be selected according to the following criteria:

- *One long-term measurement per assessment area.* A small number of assessment areas with unusual conditions may require two long-term measurement sites. For example, two measurements may be required in an assessment area where noise from idling trucks affects nighttime sound levels in one portion of the area.
- *Availability of a secure location for the noise monitor.* In general, the measurement personnel will need to use judgment regarding the security of the location. Fenced-in yards (chain link, but not stockade or other solid fences) are preferable, but not necessary. In other cases, locating and locking the monitor case in an inconspicuous location (such as on a porch or behind shrubs) may be sufficient. In extreme cases, it may be necessary to locate the monitor in an unusual location, such as on the roof of a school building. In all cases, the monitor kit must be padlocked/chained to a fence post, pipe, tree, etc.
- *Thruway noise sources (typically mainline traffic) dominate noise levels throughout the 24-hour period.* Typically, first-row locations on the unshielded sides of buildings are preferable. Interference from non-Thruway noise sources, such as local streets and central air-conditioning units, may affect the L_{dn} calculation, and should be avoided.
- *The measurement site is representative of noise-sensitive land uses within the assessment area.* It is expected that most long-term measurements will be conducted at noise-sensitive locations. However, if access to a secure noise-sensitive location is not available, it is acceptable to conduct the measurement at another secure location that meets the other criteria.

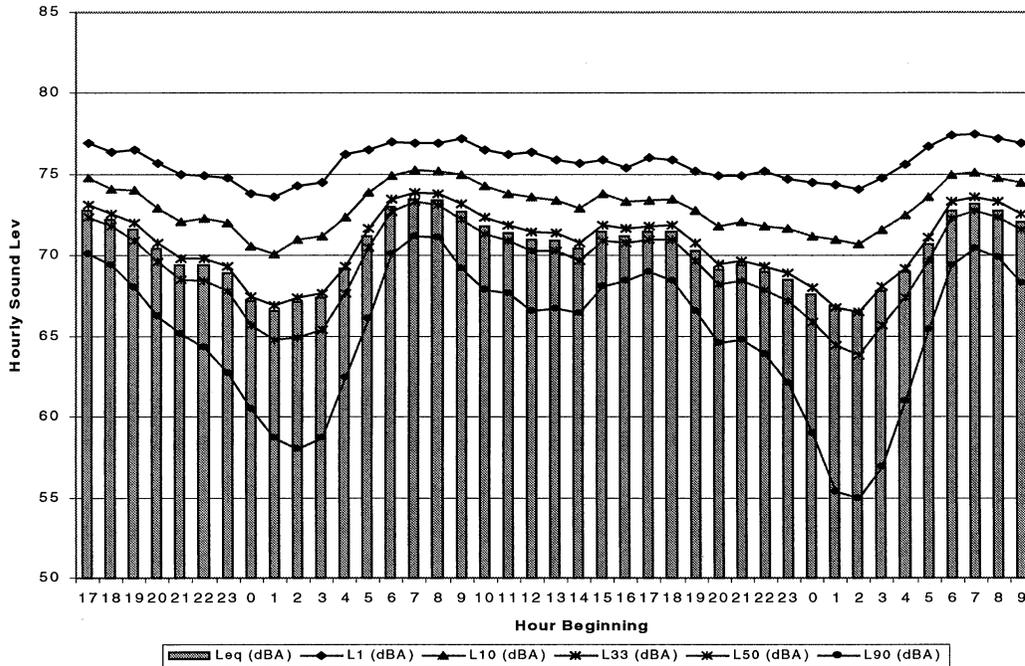

2.1.3 Procedures

- The long-term measurements will be conducted with Larson-Davis LD820 and LD870 noise monitors. All of the monitors are ANSI Precision (Type 1) instruments and have calibrations traceable to the National Institute of Standards and Technology (NIST).

- The noise monitors will be programmed to collect hourly sound level data including equivalent sound level (L_{eq}) and statistical descriptors (L_n). The hourly L_{eq} data will be used to identify loudest-hour conditions and to compute L_{dn} . The L_n data will be used primarily for diagnostic purposes. For example, the L_{33} or other metrics may be compared to the L_{eq} to evaluate whether traffic noise dominated all hourly sound levels.
- The noise monitors will be field calibrated before and after each 24-hour measurement. Prior to the measurement, the “calibration/change” feature should be used. In addition, it is good practice to conduct a “calibration/check” prior to beginning data collection. Following the measurement, the “calibration/check” feature should be used. Note that the monitor should be in “stop” mode (runner icon seated) during all calibration changes/checks.
- Prior to leaving the noise monitor ensure the following:
 1. Monitor is in “run” mode (runner icon moving).
 2. Monitor keyboard is locked.
 3. External battery is connected (check under “System”).
 4. Windscreen has been replaced on microphone following calibration.
 5. Monitor case is chained/padlocked.
- Each 24-hour measurement period will start at the beginning of an hour.
- All measurements are to be conducted between noon on Monday and noon on Friday.
- Following completion of 24 full hours of measurements and the final calibration check, the data should be downloaded using the “fkit.exe” program. Prior to downloading the data, it is good practice to scroll through the “Interval” data on the monitor to ensure that the full 24 hours of data was collected and that the measured sound levels appear to be reasonable. Following the download, check the file size to ensure that data transfer occurred.
- A long-term site log (see Appendix C-A) will be completed for each measurement site.
- Photographs will be taken of each measurement site showing the microphone location relative to the Thruway, adjacent land use, and shielding features such as terrain, bridge parapets, and buildings.
- If available, 24-hour weather data will be obtained from the nearest weather station for the measurement period.
- Following the field measurements, interval data will be transferred to a spreadsheet to be tabulated and graphed. Figure 1 provides an example of typical long-term measurement data.
- No long-term measurements will be conducted on private property without prior authorization from the owner or tenant. (See property access letter in Appendix C-B.)

Figure 1. Typical Long-term Noise Measurement Data

2.2 Short-term Measurements

Short-term noise measurements of up to approximately 20-minutes duration will be conducted at two to three measurement sites within each assessment area. An attempt will be made to perform one measurement at or near peak traffic conditions and one measurement during off-peak conditions. The short-term measurements should be conducted during an ongoing 24-hour measurement in the same assessment area.

2.2.1 Purpose

The purpose of the short-term noise measurements is to:

- Document existing sound levels at noise-sensitive locations within each assessment area.
- Obtain measurement data that will be used to "validate" the traffic-noise prediction modeling for each assessment area, thereby increasing confidence in computed noise levels at additional prediction sites.
- Obtain counted traffic data that may be used as input to the Traffic Noise Model (FHWA TNM2.0) to validate the noise modeling for each assessment area.

2.2.2 Site Selection

The short-term measurement sites should be selected according to the following criteria:

- *The measurement site is representative of noise-sensitive land uses within the assessment area.* Short-term measurement sites should be selected to represent various categories or “clusters” of noise-sensitive receptors within each assessment area. Distinguishing characteristics of various clusters may include some or all of the following:
 1. Distance to the Thruway.
 2. Absence or presence of shielding (e.g., first-row vs. second-row homes).
 3. Roadway/receiver geometry (e.g., Thruway depressed or on-fill, homes on hillside overlooking Thruway, presence of entrance/exit ramps, etc.).
 4. Influence of other noise sources such as local streets.
- *If possible, select measurement sites in areas of frequent human use.* Alternatively, measurement sites may be selected in areas that do not have frequent human use if they are acoustically-equivalent to nearby locations with frequent human use (e.g., on the grass along a side street, set back the same distance from the Thruway as the yard of the adjacent house).
- *Primary consideration should be given to first-row receivers.* Typically, traffic noise levels will be highest at the closest receivers and noise barriers will provide the greatest benefit at these locations.
- *If Thruway noise levels are sufficiently high, additional measurements at second-row or third-row locations may be beneficial.* If Thruway noise is judged to dominate the noise level at second-row and third-row locations, measurements will assist in the noise modeling validation and in determining the effects of shielding. Because this is a broad-brush priority study with only a limited number of measurement sites for each assessment area, it is *not* recommended that short-term measurements be conducted for the purpose of determining non-Thruway background sound levels in locations where Thruway noise is not judged to be dominant. Where appropriate, background sound levels will be estimated and included in the evaluation to ensure that barrier noise reduction is not over predicted.

2.2.3 Procedures

- The short-term measurements will be conducted with either ANSI Type 1 or Type 2 instruments with calibrations traceable to NIST.
- The sound level meters will be field calibrated before and after each short-term measurement.
- Measurements typically will be conducted for a 15-minute or 20-minute period. During the measurement period, the cumulative L_{eq} will be measured and recorded at five-minute intervals. If the 10-minute L_{eq} and the 15-minute L_{eq} differ by one decibel or less, the measurement may be concluded after 15 minutes. If not, the measurement will continue until the cumulative L_{eq} s recorded at two consecutive five-minute intervals meet this criterion.
- A short-term site data sheet (see Appendix C-A) will be completed for each measurement site.

- Weather data including wind speed *and direction*, temperature, and relative humidity will be recorded during each measurement period.
- During each short-term noise measurement, simultaneous traffic volume and classification counts will be conducted for all roads on which traffic is judged to make a significant contribution to the measured sound level. When feasible, counts may be conducted simultaneously for both directions of mainline traffic. If this is not feasible, traffic will be counted for alternating five-minute intervals in each direction over a 20-minute period. A traffic volume count data sheet (see Appendix C-A) will be completed for each short-term measurement.
- Traffic speeds will be estimated for each measurement period based upon the “floating car” method and other observations.
- All measurements are to be conducted between noon on Monday and noon on Friday.
- No short-term measurements will be conducted during periods of stop-and-go traffic or if the average speed is judged to vary significantly during the measurement period.
- No short-term measurements will be conducted during periods when the mainline Thruway pavement is wet.
- No short-term measurements will be conducted during periods with wind speeds in excess of 10 mph.
- Photographs will be taken of each measurement site showing the microphone location relative to the Thruway, adjacent land use, and shielding features such as terrain, bridge parapets, and buildings.
- No short-term measurements will be conducted on private property without prior authorization from the owner or tenant. (See property access letter in Appendix C-B.)

3.0 ASSESSMENT AREAS

This section of the memorandum identifies the assessment areas that will be included in the noise measurement survey and indicates the team member or members that will conduct the measurements in each area. In general, BA and FA will conduct measurements in the upstate divisions and HMMH will conduct measurements in the New York Division.

The traffic noise measurement program will include areas identified by BA during the initial screening study and areas identified during previous NYSTA traffic noise evaluations. Some of the assessment areas were added, dropped, or extended based on field visits and review of aerial photography subsequent to the project kick-off meeting.

The locations where the initial screening was performed include:

- The Thruway Main Line (Mile Post 0.00 to Mile Post 496.00)
- New England Section (Mile Post NE 0.00 to Mile Post NE 15.01)
- Garden State Parkway Connection (Mile Post GSP 0.00 to GSP Mile Post 2.40)
- Berkshire Section (Mile Post B 0.00 to Mile Post B 24.28)
- Niagara Section (Mile Post N 0.00 to Mile Post N 21.10)

Previous NYSTA traffic noise evaluations included Westchester, Orange, and Rockland Counties^{2,3,4}.

Tables 2.1, 2.2, 2.3, and 2.4 on the following pages identify the candidate assessment areas within each of the Thruway Divisions and the figures included in Appendix C-C indicate the approximate location of each area. For each assessment area, the tables provide the approximate Thruway milepost limits, and, if applicable, the identification number used in any previous noise studies. In addition, the last column of each table shows which project team member will conduct the measurements in each assessment area.

4.0 SCHEDULE

The measurement program is intended to commence during the week of October 7 and to take approximately six weeks to complete, ending by approximately November 15. The actual schedule may be affected by weather conditions or other circumstances beyond the control of the project team.

Re: Noise Mitigation and Prioritization Study

Dear Sir or Madam:

The New York State Thruway Authority is conducting a Thruway-wide Noise Mitigation and Prioritization Study. The study will require collecting both 24-hour noise measurements and short term (less than 30 min.) noise measurements at various locations along the Thruway. The measurements will be collected using noise-monitoring equipment.

This letter is to advise you that between October to November of 2002, a representative of the Authority may be contacting you to request access to your property for the purpose of setting up noise monitoring equipment. Our representatives have been instructed to minimize any inconvenience to you and to avoid any damage to your property.

We regret having to trouble you, but your cooperation with this matter will help us to collect accurate and reliable information concerning the noise levels in your neighborhood.

If you have any questions, please feel free to contract our Project Manger, Mr. Al Mastroianni, at (518) 471-4264 or me at (518) 436-2916.

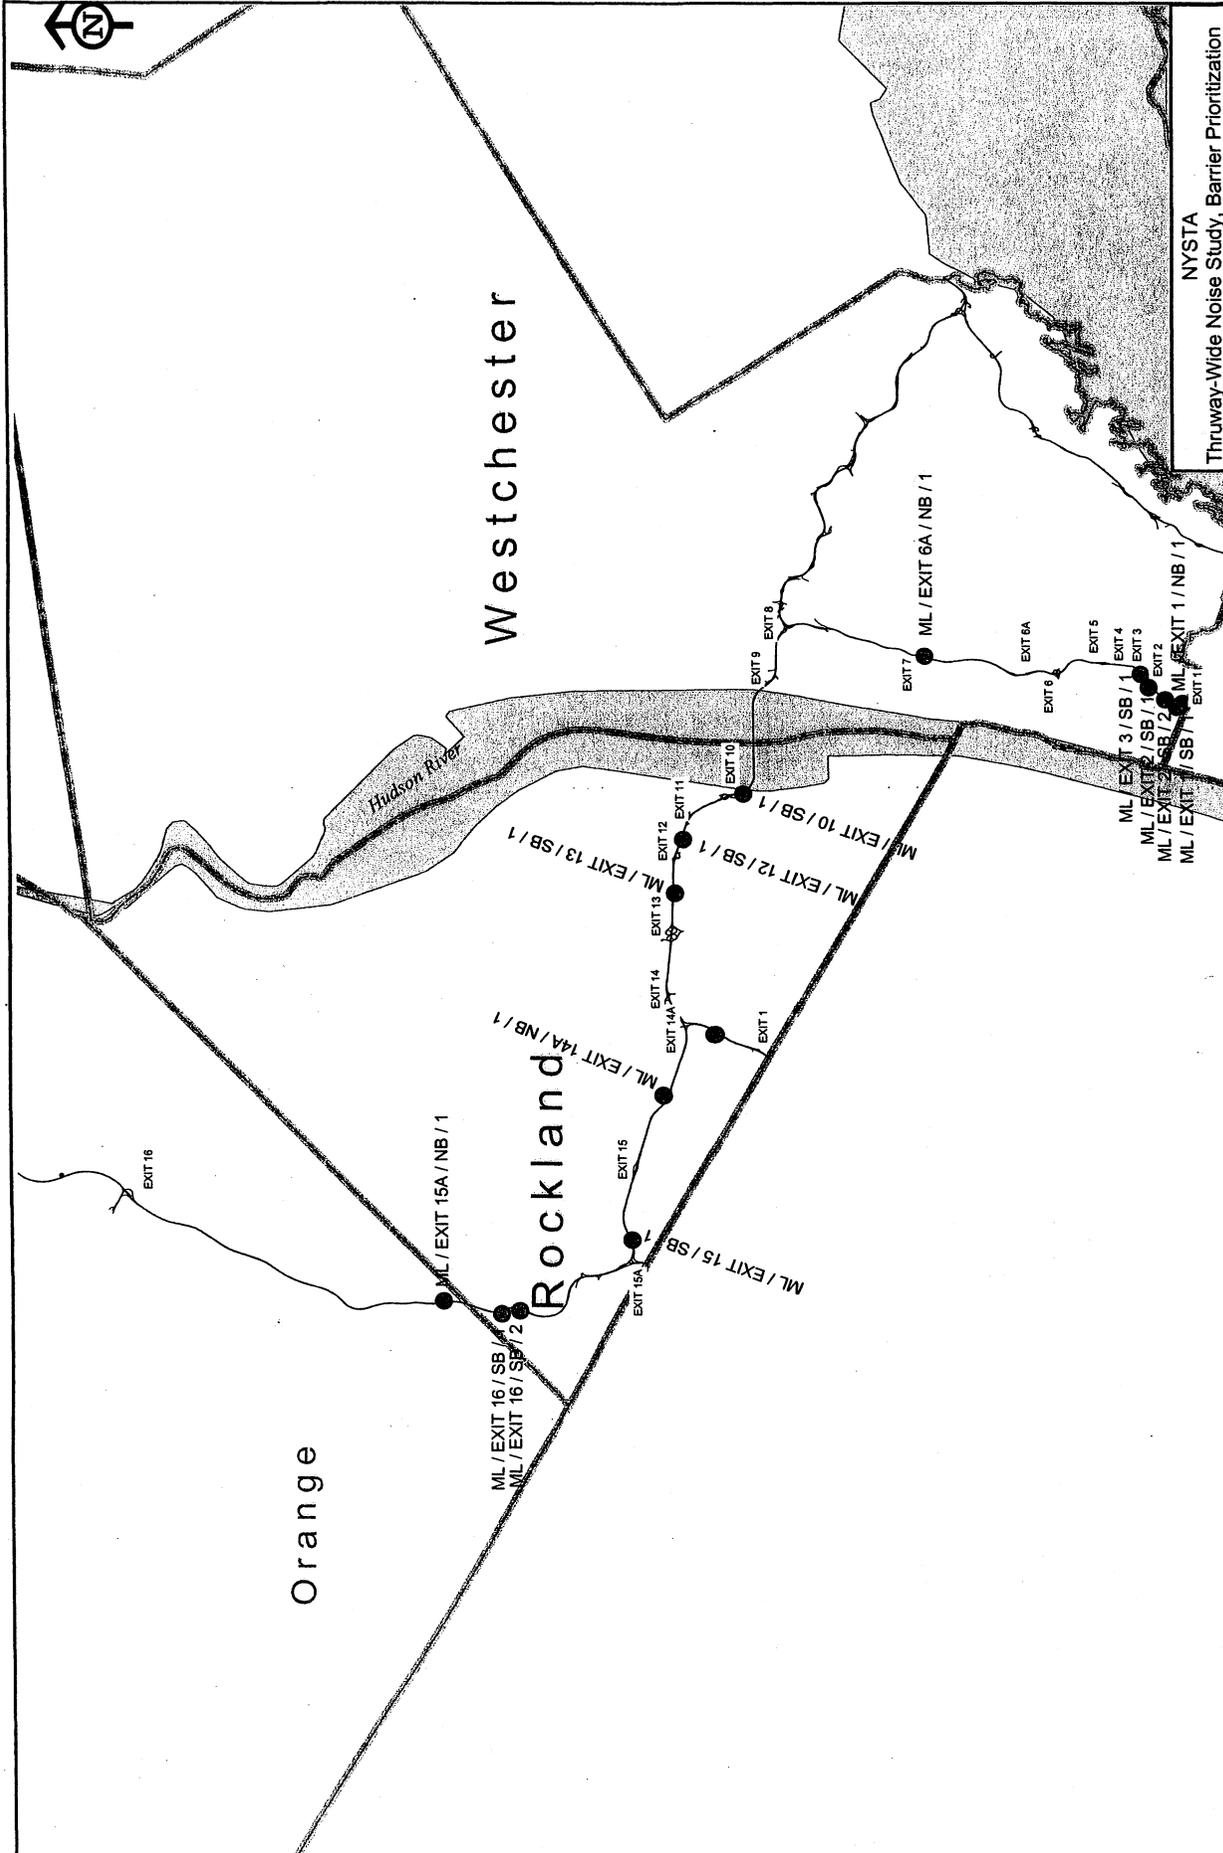

Sincerely,

CHRISTINA M. TROISI, P.E.
Director, Bureau of Highway Design

CMT:ASM:pt
CC: Mr. P. Melewski

APPENDIX E NOISE MEASUREMENTS: FIELD SHEETS FOR LONG-TERM SITES

This appendix contains additional details about the study's noise-measurements (Section 4, above). In particular, it contains:

- All Long Term Noise Monitoring Site Logs—reproduced on the following pages.

PROJECT: _____
 JOB NO.: _____

System-wide Noise Barrier Prioritization Study
LONG TERM NOISE MONITORING SITE LOG

ASSESSMENT AREA ID: EXH1 SB1 MEASUREMENT SITE NO.: 1

ADDRESS: 11 Central Park Ave South

OWNER: _____

DESCRIPTION: _____

NOISE SOURCES: I-87, frontage rd

NOISE MONITOR: _____ S/N: 10-5

MICROPHONE: _____ S/N: 0925

CALIBRATOR: _____ S/N: 2880

START DATE: 10/17/02 END DATE: 10/18/02

START TIME: 0840 END TIME: 10:35

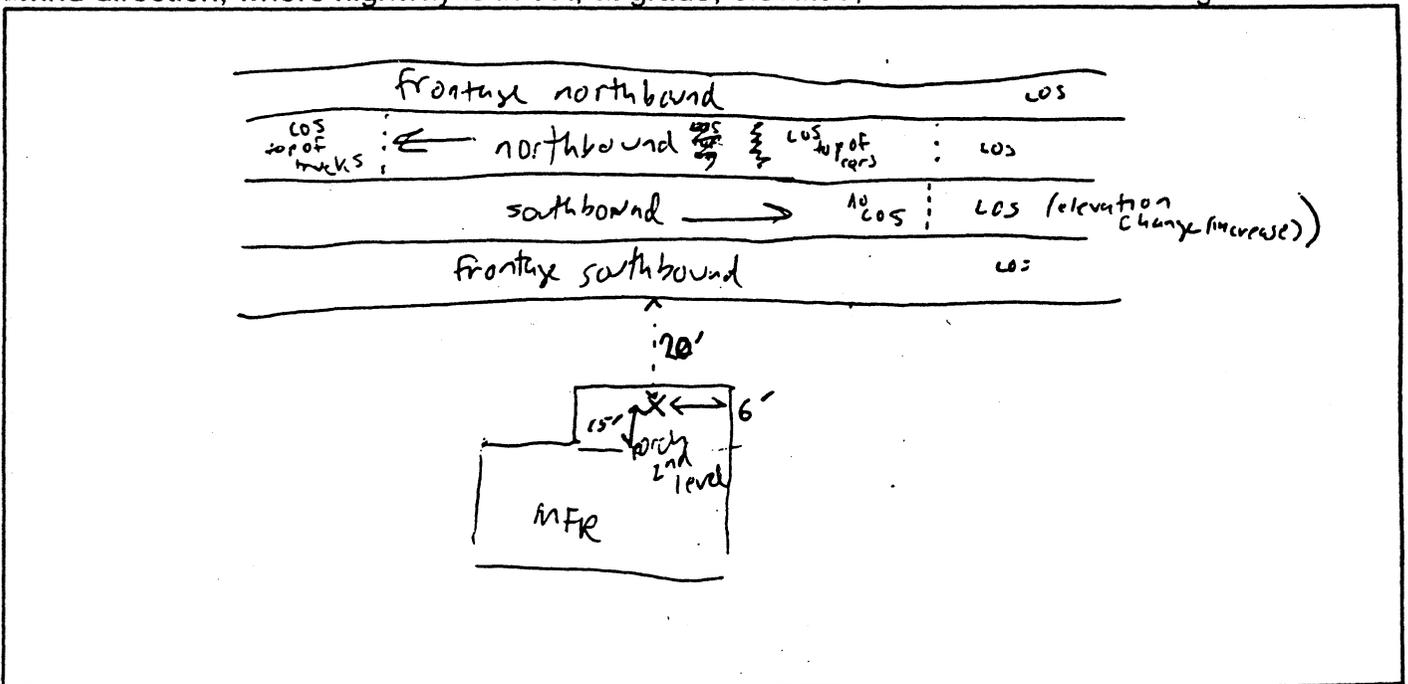

SYNCH W/HOURS? yes

METRICS STORED: _____

EXCEEDENCE THRESHOLD: _____ EXCEEDENCE DURATION: _____

AVERAGE TEMP. (°F): 55-60°F WEATHER CONDITIONS: clear, overnight rain

SITE SKETCH: Show highway, homes, local roads, reference distances, arrows for North & wind direction, where highway is in cut, at grade, elevated, where direct lines of sight exist.

PROJECT:
JOB NO.: 298550.003

System-wide Noise Barrier Prioritization Study
LONG TERM NOISE MONITORING SITE LOG

ASSESSMENT AREA ID: Exit 1/NB/1 MEASUREMENT SITE NO.: 1

ADDRESS: 13 Longmeadow

OWNER: _____

DESCRIPTION: Single family house

NOISE SOURCES: I-87 + surface St (Central Park Avenue)

NOISE MONITOR: LDS70 S/N: 1418

MICROPHONE: LD PRM 900C S/N: 0917/0653
